Non-state actors, such as international environmental organisations, business associations and indigenous peoples’ organisations, increasingly take on governance functions that can influence the delivery of global public goods. This thesis examines the roles of these actors in the field of global climate change governance. Specifically, the thesis examines why and how non-state actors are involved in global climate change governance; the governance activities that they may perform and are perceived to perform, and their views on climate change solutions. The thesis also discusses the implications of their roles for how authority is shared between states and non-state actors in global climate change governance.
